MECHANICAL SUSPENSION KITS

MOUNTING HEIGHT SPRING SEAT SELECTION

IMPORTANT: It is the installer's responsibility to select the correct mounting height. There should be at least 4 1/2" of vertical tire clearance with an unloaded vehicle. In addition, clearance must be provided at the side, front, and rear of the tires to prevent tire contact during suspension movement. The mounting heights, shown below, are nominal values and may vary due to variations in the leaf springs and other components.

IMPORTANT: Mounting heights should not exceed 17 1/2" for best performance. Mounting height should provide a minimum of 4 1/2" of tire clearance with an empty vehicle. This table applies to under mount or flange mount hangers on a multi-axle suspension. For single axle suspensions, subtract 1/2" from the above heights. For straddle mount hangers, subtract 1/2" from above heights.

IMPORTANT: Mounting heights less than 4 1/2" are not suggested due to lack of clearance between the axle and trailer frame. Mounting height should provide a minimum of 4 1/2" of tire clearance with an empty vehicle. Sufficient clearance should be provided for axle movement. This table applies to under mount or flange mount hangers with a multi-axle suspension. For single axle suspensions, subtract 1/2" from the above heights. For straddle mount hangers, subtract 1/2" from the above heights.
