

SAF® Hub/Wheel Bearing Lubrication Upgrade for All Dressed Axles – P89 Disc and SC5 Drum Brakes with Oil Fill Hubs

Effective: May 22, 2019

Attention:

SAF-HOLLAND® is implementing a product change to all SAF branded dressed drum and disc brake wheel end packages supplied to enhance overall performance and service life. The new synthetic based SAE 75W-90 oil will replace the current conventional SAE 80/90 weight oil for all oil fill hubs supplied by SAF-HOLLAND. This **DOES NOT** impact any hub/bearing combinations that are specified with semi-fluid grease from SAF-HOLLAND as the semi-fluid grease supplied is already a synthetic base grease.

This change to a premium synthetic oil further compliments our overall extended wheel end warranty packages and simplifies our product offering. Fleet customers should expect to realize:

- Extended drain capabilities for longer service intervals
- Excellent thermal and oxidation stability – extended oil life
- High viscosity index and low pour point – greater operating temperature range for hot and cold conditions
